

Cyclistic Case Study Summary

Chinua Eric Robinson · Google Data Analytics capstone · Public Divvy (Chicago) trip data, Q1 2019 and Q1 2020 · Cyclistic is fictional

Business task

Find how annual members and casual riders use the bikes differently, to guide a campaign that converts casual riders into members.

Data and cleaning

791,956 trips from two quarters, combined to one schema. 3,767 rides from the HQ QR test station were removed, which also removed every zero or negative ride length, leaving 788,189 rides.

Key findings

	Annual members	Casual riders
Share of rides	91%	9%
Median ride (min)	8.5	23.2
Share of ride time	61%	39%
Rides on weekends	17%	47%

Members ride on weekdays and peak at 8 AM and 5 PM, a commuting pattern. Casual riders ride most on weekends, take longer rides every day of the week, and start mostly at lakefront and attraction stations.

Members ride far more often, and mostly on weekdays

Number of rides by day of week

Member weekday rides peak at commute hours

Share of each group's weekday rides, by start hour

Recommendations

1. Pitch membership around weekend and longer leisure rides rather than commuting.
2. Place membership offers at the top casual start stations, on dock screens and in the app.
3. Confirm the seasonal peak with full-year data before timing the campaign; these are winter quarters.

Deliverables: analysis/cyclistic_analysis.R, tables in outputs/, charts in outputs/charts/, Word report and slide deck. Every figure is produced by the script.
